# Introduction

- ▶ Why study triangulated categories?
- ▶ Stable Frobenius Categories vs. Stable Homotopy Categories

# Candidate Triangles

Assume that:

- ▶  $\mathcal{T}$  an additive category
- ▶  $\Sigma_{\mathcal{T}} : \mathcal{T} \rightarrow \mathcal{T}$  an additive autoequivalence

## Definition (Candidate triangle)

Candidate triangle:  $A \xrightarrow{a} B \xrightarrow{b} C \xrightarrow{c} \Sigma_{\mathcal{T}} A$

Morphism:

$$\begin{array}{ccccccc} A & \xrightarrow{a} & B & \xrightarrow{b} & C & \xrightarrow{c} & \Sigma_{\mathcal{T}} A \\ \downarrow \phi_A & & \downarrow \phi_B & & \downarrow \phi_C & & \downarrow \Sigma_{\mathcal{T}} \phi_A \\ A' & \xrightarrow{a'} & B' & \xrightarrow{b'} & C' & \xrightarrow{c'} & \Sigma_{\mathcal{T}} A' \end{array}$$

# Triangulation axioms; I

A triangulated category is a triple  $(\mathcal{T}, \Sigma_{\mathcal{T}}, \Delta_{\mathcal{T}})$  where  $\Delta_{\mathcal{T}}$  is a triangulation.

## Definition (Triangulation)

- ▶  $\Delta_{\mathcal{T}}$  class of candidate triangles
- ▶ Element of  $\Delta_{\mathcal{T}}$  is called triangle
- ▶  $\Delta_{\mathcal{T}}$  is a triangulation if it satisfies the following axioms:

### TR1 Bookkeeping axiom

1. A candidate triangle isomorphic to a triangle is a triangle
2. For every morphism  $a : A \rightarrow B$  there is a triangle

$$A \xrightarrow{a} B \xrightarrow{b} C \xrightarrow{c} \Sigma_{\mathcal{T}} A$$

3. For every object  $A : \mathcal{T}$  there is a triangle

$$A \xrightarrow{id_A} A \xrightarrow{0} 0 \xrightarrow{0} \Sigma_{\mathcal{T}} A$$

# Triangulation axioms; II

## TR2 Rotation axiom

Given a triangle

$$A \xrightarrow{a} B \xrightarrow{b} C \xrightarrow{c} \Sigma_{\mathcal{T}} A$$

there are triangles

$$B \xrightarrow{b} C \xrightarrow{c} \Sigma_{\mathcal{T}} A \xrightarrow{-\Sigma_{\mathcal{T}} a} \Sigma_{\mathcal{T}} B$$

$$\Sigma_{\mathcal{T}}^{-1} C \xrightarrow{-\Sigma_{\mathcal{T}}^{-1} c} A \xrightarrow{a} B \xrightarrow{b} C$$

## TR3 Morphism axiom

Two triangles and a square of morphisms between the triangles may be completed to a triangle morphism.

$$\begin{array}{ccc} A \xrightarrow{a} B & & A \xrightarrow{a} B \xrightarrow{b} C \xrightarrow{c} \Sigma_{\mathcal{T}} A \\ \downarrow \phi_A \quad \downarrow \phi_B & \implies & \downarrow \phi_A \quad \downarrow \phi_B \quad \downarrow \phi_C \quad \downarrow \Sigma_{\mathcal{T}} \phi_A \\ A' \xrightarrow{a'} B' & & A' \xrightarrow{a'} B' \xrightarrow{b'} C \xrightarrow{c'} \Sigma_{\mathcal{T}} A' \end{array}$$

# Triangulation axioms; III

## TR4 Octahedron axiom

Given three triangles

$$(1) \quad A \xrightarrow{a} B \xrightarrow{x} C' \xrightarrow{x'} \Sigma_{\mathcal{T}} A$$

$$(2) \quad B \xrightarrow{b} C \xrightarrow{y} A' \xrightarrow{y'} \Sigma_{\mathcal{T}} B$$

$$(3) \quad A \xrightarrow{b \circ a} C \xrightarrow{z} B' \xrightarrow{z'} \Sigma_{\mathcal{T}} A$$

such that there is a commutative diagram

$$\begin{array}{ccc} A & \xrightarrow{a} & B \\ & \searrow b \circ a & \downarrow b \\ & & C \end{array}$$

# Triangulation axioms; III

## TR4 Octahedron axiom

then there exists morphisms  $f$  and  $g$  making the third row a triangle.

$$\begin{array}{ccccccc}
 \Sigma_{\mathcal{T}}^{-1} B' & \xrightarrow{\Sigma_{\mathcal{T}}^{-1} z'} & A & \xlongequal{\quad id_A \quad} & A & & \\
 \downarrow \Sigma_{\mathcal{T}}^{-1} g & & \downarrow a & & \downarrow b \circ a & & \\
 \Sigma_{\mathcal{T}}^{-1} A' & \xrightarrow{\Sigma_{\mathcal{T}}^{-1} y'} & B & \xrightarrow{\quad b \quad} & C & \xrightarrow{\quad y \quad} & A' \xrightarrow{\quad y' \quad} \Sigma_{\mathcal{T}} B \\
 & & \downarrow x & & \downarrow z & & \parallel id_{A'} \downarrow \Sigma_{\mathcal{T}} x \\
 & & C' & \xrightarrow{\quad \text{---} f \text{---} \quad} & B' & \xrightarrow{\quad \text{---} g \text{---} \quad} & A' \xrightarrow{\Sigma_{\mathcal{T}} x \circ y'} \Sigma_{\mathcal{T}} C' \\
 & & \downarrow x' & & \downarrow z' & & \\
 & & \Sigma_{\mathcal{T}} A & \xlongequal{\quad id_{\Sigma_{\mathcal{T}} A} \quad} & \Sigma_{\mathcal{T}} A & & 
 \end{array}$$

# Triangulation axioms; III

## TR4 Octahedron axiom

# Triangulation axioms; III

## TR4 Octahedron axiom

There exist morphisms  $f : C' \rightarrow B'$  and  $g : B' \rightarrow A'$ , and the squiggly teal back face is a triangle.

# Functors

## Definition (Triangulated functor)

A functor  $F : \mathcal{T} \rightarrow \mathcal{S}$  between triangulated categories is called triangulated if:

- ▶  $\phi : F \circ \Sigma_{\mathcal{T}} \Longrightarrow \Sigma_{\mathcal{S}} \circ F$  is a natural isomorphism
- ▶  $F(\Delta_{\mathcal{T}}) \subseteq \Delta_{\mathcal{S}}$

# Functors

## Definition (Triangulated functor)

A functor  $F : \mathcal{T} \rightarrow \mathcal{S}$  between triangulated categories is called triangulated if:

- ▶  $\phi : F \circ \Sigma_{\mathcal{T}} \Rightarrow \Sigma_{\mathcal{S}} \circ F$  is a natural isomorphism
- ▶  $F(\Delta_{\mathcal{T}}) \subseteq \Delta_{\mathcal{S}}$

## Definition (Homological functor)

A covariant functor  $H : \mathcal{T} \rightarrow \mathcal{A}$  from a triangulated category and an abelian category is called homological if it sends triangles to long exact sequences.

$$\begin{array}{ccc}
 A & \xrightarrow{a} & B \\
 \Sigma_{\mathcal{T}} \uparrow c & & \nwarrow b \\
 C & & 
 \end{array}
 \Rightarrow
 \begin{array}{c}
 \dots \rightarrow H(\Sigma_{\mathcal{T}}^i A) \xrightarrow{H(\Sigma_{\mathcal{T}}^i a)} H(\Sigma_{\mathcal{T}}^i B) \xrightarrow{H(\Sigma_{\mathcal{T}}^i b)} H(\Sigma_{\mathcal{T}}^i C) \\
 \hspace{10em} \downarrow H(\Sigma_{\mathcal{T}}^i c) \\
 \hspace{10em} H(\Sigma_{\mathcal{T}}^{i+1} A) \xrightarrow{H(\Sigma_{\mathcal{T}}^{i+1} a)} H(\Sigma_{\mathcal{T}}^{i+1} B) \xrightarrow{H(\Sigma_{\mathcal{T}}^{i+1} b)} H(\Sigma_{\mathcal{T}}^{i+1} C) \rightarrow \dots
 \end{array}$$

# Functors

### Definition (Triangulated functor)

A functor  $F : \mathcal{T} \rightarrow \mathcal{S}$  between triangulated categories is called triangulated if:

- ▶  $\phi : F \circ \Sigma_{\mathcal{T}} \Rightarrow \Sigma_{\mathcal{S}} \circ F$  is a natural isomorphism
- ▶  $F(\Delta_{\mathcal{T}}) \subseteq \Delta_{\mathcal{S}}$

### Definition (Cohomological functor)

A contravariant functor  $H : \mathcal{T} \rightarrow \mathcal{A}$  from a triangulated category and an abelian category is called cohomological if it sends triangles to long exact sequences.

$$\begin{array}{c} A \\ \Sigma_{\mathcal{T}} \uparrow \\ C \end{array} \begin{array}{l} \searrow a \\ \swarrow b \end{array} B \quad \Rightarrow \quad \dots \leftarrow H(\Sigma_{\mathcal{T}}^{i-1}A) \xleftarrow{H(\Sigma_{\mathcal{T}}^{i-1}a)} H(\Sigma_{\mathcal{T}}^{i-1}B) \xleftarrow{H(\Sigma_{\mathcal{T}}^{i-1}b)} H(\Sigma_{\mathcal{T}}^{i-1}C) \leftarrow \dots$$
  

$$H(\Sigma_{\mathcal{T}}^i c) \xrightarrow{\quad} H(\Sigma_{\mathcal{T}}^i A) \xleftarrow{H(\Sigma_{\mathcal{T}}^i a)} H(\Sigma_{\mathcal{T}}^i B) \xleftarrow{H(\Sigma_{\mathcal{T}}^i b)} H(\Sigma_{\mathcal{T}}^i C) \leftarrow \dots$$

# Hom-functor

## Lemma (Hom is (co)homological)

For any  $M : \mathcal{T}$

- ▶  $\mathcal{T}(M, -) : \mathcal{T} \rightarrow \mathcal{A}$  is a homological functor.
- ▶  $\mathcal{T}(-, M) : \mathcal{T} \rightarrow \mathcal{A}$  is a cohomological functor

# Hom-functor

## Lemma (Hom is (co)homological)

For any  $M : \mathcal{T}$

- ▶  $\mathcal{T}(M, -) : \mathcal{T} \rightarrow \mathcal{A}$  is a homological functor.
- ▶  $\mathcal{T}(-, M) : \mathcal{T} \rightarrow \mathcal{A}$  is a cohomological functor

## Lemma (2-out-of-3 property)

If 2-out-of-3 of the triangle morphism are isomorphism, the final one is as well.

$$\begin{array}{ccccccc} A & \xrightarrow{a} & B & \xrightarrow{b} & C & \xrightarrow{c} & \Sigma_{\mathcal{T}} A \\ \wr \downarrow \phi_A & & \wr \downarrow \phi_B & & \wr \downarrow \phi_C & & \wr \downarrow \Sigma_{\mathcal{T}} \phi_A \\ A' & \xrightarrow{a'} & B' & \xrightarrow{b'} & C' & \xrightarrow{c'} & \Sigma_{\mathcal{T}} A' \end{array}$$

# Localization; I

## Definition (Localization)

Let  $S$  be a collection of morphisms in the category  $\mathcal{C}$ . The Localization of  $\mathcal{C}$  on  $S$  is the category  $\mathcal{C}[S^{-1}]$  together with a functor  $q : \mathcal{C} \rightarrow \mathcal{C}[S^{-1}]$  such that:

- ▶  $\forall s : S$  such that  $q(s)$  is an isomorphism
- ▶ Any functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  such that for any  $s : S$  such that  $F(s)$  is an isomorphism, then  $F$  factors through  $q$ . That is to say that there is a natural isomorphism  $\eta : F \rightarrow F' \circ q$  so that  $\mathcal{C}[S^{-1}]$  is the universal category where morphisms in  $S$  are isomorphisms.

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ & \searrow q & \nearrow F' \\ & \mathcal{C}[S^{-1}] & \end{array}$$

$\eta$  (vertical double arrow from  $F$  to  $q$ )

# Calculus of Fractions

## Definition (Right multiplicative system)

A set  $S$  of morphisms in a category  $\mathcal{C}$  is called right multiplicative if it satisfies the following conditions:

- ▶  $S$  is closed under composition, and has every identity morphism.
- ▶ (Right Ore condition)

$$(1) \quad \begin{array}{ccc} W & \overset{f}{\dashrightarrow} & X \\ \downarrow s & & \downarrow t \\ Z & \xrightarrow{g} & Y \end{array}$$

- ▶ (Left cancellation) Suppose  $f, g : X \rightarrow Y$  are parallel morphisms in  $\mathcal{C}$ , then 1.  $\implies$  2.:
  1.  $sf = sg$  for som  $s : S$  starting at  $Y$
  2.  $ft = gt$  for som  $t : S$  ending at  $X$

# Calculus of Fractions

## Definition (Right fractions)

$S$  is a right multiplicative system

$$X \xleftarrow{s} Y \xrightarrow{t} Z$$

Right fractions are denoted as  $ts^{-1}$ .

- ▶ Let  $\sim$  be the equivalence relation of right fractions such that  $ts^{-1} \sim t's'^{-1}$  if and only if  $\exists w, w' : \mathcal{C}$  making the diagram below commute and the middle row a right fraction.

# Calculus of Fractions

## Definition (Right fractions)

$S$  is a right multiplicative system

$$X \xleftarrow[s]{} Y \xrightarrow{t} Z$$

Right fractions are denoted as  $ts^{-1}$ .

- ▶ Let  $S^{-1}\mathcal{C}$  denote the category with objects from  $\mathcal{C}$  and arrows are right fractions modulo  $\sim$ .

## Set theory issues

There is no reason for this category to have small homsets between objects.

# Localization; II

## Theorem (Gabriel-Zisman)

*Let  $S$  be a locally small right multiplicative system of morphisms in a category  $\mathcal{C}$ . Then the category  $\mathfrak{r}S^{-1}\mathcal{C}$  exists and it is the localization of  $\mathcal{C}$  on  $S$ . This means that there is an equivalence of categories  $\mathcal{C}[S^{-1}] \simeq \mathfrak{r}S^{-1}\mathcal{C}$  together with a functor  $q : \mathcal{C} \rightarrow \mathfrak{r}S^{-1}\mathcal{C}$  sending a morphism  $f : X \rightarrow Y$  to the right fraction  $f \circ id_X^{-1}$ .*

# Subcategories

## Definition (Triangulated subcategory)

A triangulated subcategory  $\mathcal{S}$  of a triangulated category  $\mathcal{T}$  is a full additive subcategory such that the inclusion functor is triangulated.

## Definition ( $Mor_{\mathcal{S}}$ )

Let  $\mathcal{C}$  be a triangulated category and  $\mathcal{S} \subseteq \mathcal{C}$  be a triangulated subcategory. Define the collection  $Mor_{\mathcal{S}}$  to be a collection of morphisms in  $\mathcal{C}$  such that for any  $f : Mor_{\mathcal{S}}$  there is a triangle with  $C : \mathcal{S}$ .

$$A \xrightarrow{f} B \longrightarrow C \longrightarrow \Sigma_{\mathcal{C}} A$$

# Verdier quotient

## Lemma

*Let  $\mathcal{S} \subseteq \mathcal{C}$  be triangulated categories, then  $\text{Mor}_{\mathcal{S}}$  is a multiplicative system.*

## Theorem (Verdier Quotient)

*The Verdier quotient  $\mathcal{C}/\mathcal{S}$ , defined as  $\text{Mor}_{\mathcal{S}}^{-1}\mathcal{C}$ , together with the functor  $q : \mathcal{C} \rightarrow \mathcal{C}/\mathcal{S}$  is the universal triangulated category where morphisms in  $\text{Mor}_{\mathcal{S}}$  are isomorphisms.*

# Exact categories

## Definition (Kernel-cokernel pair)

- ▶  $\mathcal{A}$  is an additive category
- ▶  $(p, q)$  is a kernel-cokernel pair if  $p$  is the kernel of  $q$  and  $q$  is the cokernel of  $p$
- ▶ A morphism of kernel-cokernel pairs are diagrams

$$\begin{array}{ccccc} A & \xrightarrow{p} & B & \xrightarrow{q} & C \\ \downarrow f & & \downarrow g & & \downarrow h \\ A' & \xrightarrow{p'} & B' & \xrightarrow{q'} & C' \end{array}$$

# Exact categories

An exact structure for an additive category  $\mathcal{A}$  is a class  $\mathcal{E}$  of kernel-cokernel pairs which are closed under isomorphisms. A pair  $(p, q) : \mathcal{E}$  is called a conflation, here  $p$  is called an inflation and  $q$  is called a deflation.  $(\mathcal{A}, \mathcal{E})$  is called exact when the following axioms holds:

- ▶ (QE0)  $\forall A : \mathcal{A}, id_A$  is both an inflation and a deflation.
- ▶ (QE1) Both inflations and deflations are closed under composition.
- ▶ (QE2) The push-out of an inflation is an inflation.
- ▶ (QE2<sup>op</sup>) The pull-back of a deflation is a deflation.

An exact category is the additive category  $\mathcal{A}$  together with an exact structure  $\mathcal{E}$ .

# Examples of exact categories

## Example

Any abelian category is exact with every short exact sequence as the exact structure. This exact structure is  $\mathcal{E}_{\max}$ .

## Example

Any additive category is exact with every split short exact sequence as the exact structure. This structure will always be  $\mathcal{E}_{\min}$ , and it is always contained inside another exact structure.

# Projective and injective objects
